CAMSTREAMER APP

How does CamStreamer App work?

CamStreamer App is **smart application running inside** an Axis network camera. No public IP address, additional hardware, or complex configuration is required.

With the help of camera's computing power, **CamStreamer App** sends live video feed from the camera directly to a streaming platform of your choice.

Your broadcast can be **planned, recurrent** or **one-time** on a specific date and time. You can also start the manually via HW button or API commands.

Everything is controlled through a clear **user interface**, which is available both in the browser and with cloud remote access in the mobile app. Get inspired by the live streams at <https://camstreamer.com/live>.
